What is PLAYERZWZ?

PLAYERZWZ is a mobile-based sports matchmaking and arena booking application designed to make sports planning easier and faster.

Instead of relying on personal contacts or informal WhatsApp groups, users can instantly find nearby players who are interested in the same sport and available at the exact same time.

The application seamlessly integrates location-based services with Artificial Intelligence to recommend suitable games, ensure player reliability, and book sports facilities effortlessly.

⚠️ PROBLEM STATEMENT

Current sports coordination methods are inefficient

- ⊗ **Difficulty Finding Players:** Hard to find players for sports like cricket or football on short notice.
- ⊗ **Unreliable Participants:** High rate of last-minute cancellations and no-shows ruin the game.
- ⊗ **Lack of Trust:** Players hesitate to invite unknown individuals to fill team gaps.
- ⊗ **Fragmented Booking:** Manual and time-consuming methods to book sports grounds and arenas.

Here's a comparison of current tools

Platform / Tool	Key Capabilities	Major Limitations
WhatsApp & Facebook Groups	Informal chatting, event posting, large community reach.	No intelligent matching, heavily manual coordination, high no-show rates.
Standard Arena Booking Apps	View venue availability, process payments, book slots.	Focuses only on venues. Cannot help you find players if your team is short.
General Social Networking	Connecting with friends, organizing generic events.	Lacks sports-specific features like skill-level matching and reliability scoring.
PLAYERZWZ (Our Solution)	Location-based discovery, AI Matchmaking, Venue Booking.	All-in-one integrated platform bridging all existing gaps.

Revolutionizing Sports Management with AI

AI-Driven Matchmaking

Suggests suitable games and recommends reliable players based on past activity and behavior.

Reputation System

Evaluates reliability and discourages repeated no-shows using an intelligent rating mechanism.

Seamless Integration

Combines location-aware player discovery with instant sports arena booking in a single hub.

The features you get here

Location-Based Discovery

Instantly scan your proximity to find nearby players and available sports facilities in real-time.

Game Creation & Joining

Create a public/private game specifying sport, time, and player count, or instantly join open slots nearby.

Player Rating System

Build trust through a transparent rating system that highlights dependable users and flags no-shows.

Arena Discovery & Booking

Browse local sports complexes, view pricing structures, and book arenas directly without making a call.

Iterative Agile Development Plan

Our project follows an agile approach ensuring flexibility, continuous testing, and incremental improvements across 2 regular semesters.

Months 1-2

Requirement analysis, user surveys, and architecture design.

Months 3-4

Backend (Flask), Firebase setup, and core APIs.

Months 5-6

Flutter App Dev, location integration, and UI completion.

Months 7-10

AI Logic integration, reputation scoring, and optimization.

Months 11-12

Final system testing, deployment, and documentation.

What technologies we'll be using?

Flutter (Dart)

Dynamic cross-platform mobile app frontend development.

Python & Flask

Robust backend server-side development and APIs.

Firebase

NoSQL database for secure data and user authentication.

Google Maps

Accurate location-based services for player discovery.

Scikit-learn

Machine learning models powering intelligent matchmaking.

GitHub

Version control, team collaboration, and repository management.

What we aim to achieve

Faster Matching

Significantly reduce wait times in finding available, relevant players nearby.

Fewer Cancellations

Decrease the frequency of cancelled games caused by missing team members.

Improved Trust

Establish a secure, reliable community through transparent user reputation scoring.

Increased Participation

Encourage a healthier lifestyle by removing friction in sports coordination.

Foreseeable Obstacles & Mitigations

-  **Real-time Location Scalability:** Ensuring high performance and low latency when querying dynamic user locations on the map.
-  **AI "Cold Start" Problem:** Collecting sufficient behavioral data early on to train the ML models (mitigated via hybrid rule-based logic).
-  **Fair Reputation Balancing:** Designing a rating system strict enough to prevent no-shows, but fair enough to handle genuine emergencies.

We're here to hear from you!

Feel free to ask questions.

We're all ears! :)

Thank you for your precious time.

HOPING FOR APPROVAL
